FAQs

Product FAQs

1. **What are the most approved payment gateway libraries for checkout in the HDFC Collect Now Program?**
The most used payment gateway libraries for checkout in the HDFC Collect Now Program are: • For Website Integration: Embedded checkout (Embedded) • For Mobile Integration: Standard Checkout (Checkout.js)

2. **What are the go-to Documents for the Payment Gateway integration in the HDFC CN program?**
Please refer to the Integration documents below: • Website integration: **Embedded checkout** • Mobile Integration**: Android, IOS, React, Flutter.**

3. **What are the poll APIs to recheck the payment status?**
We can use the poll APIs to fetch and check the payment status using the payment_id or Order_id. Document for Payment status check through **Payment_id**: here Payment status check through **Order_id**: here

4. **Signature verification failed, how to handle this ?**

Signature verification fails if any parameter in the provided details is incorrect or missing, even a single extra space can cause an issue.

Please refer to the following Algorithm and sample code here.

5. What are the applications of webhooks ?

Webhooks can be used to get real-time push notifications about the payment status.
To know more about webhooks, please refer: https://razorpay.com/docs/webhooks/

6. How many webhooks are allowed per Merchant ID ?

For Razorpay Payments, you can create up to 30 different webhook URLs.

7. Why is my webhook disabled ?

Please note that Razorpay considers any non-2xx response as an event delivery failure. Please make sure the API responds with 2xx when you successfully consume the event at your end. Whenever a webhook is disabled, you are notified on your Alert Email Address as configured during webhook setup. If no Alert Email Address was provided during webhook setup, an email is sent to the email address configured under Settings on the Razorpay Dashboard.

8. Why am I not able to consume webhooks in the production environment, whereas I can consume in the test environment ?

Razorpay Production environment does not support the older versions of TLS 1.0 and 1.1 due to security concerns around these protocols.

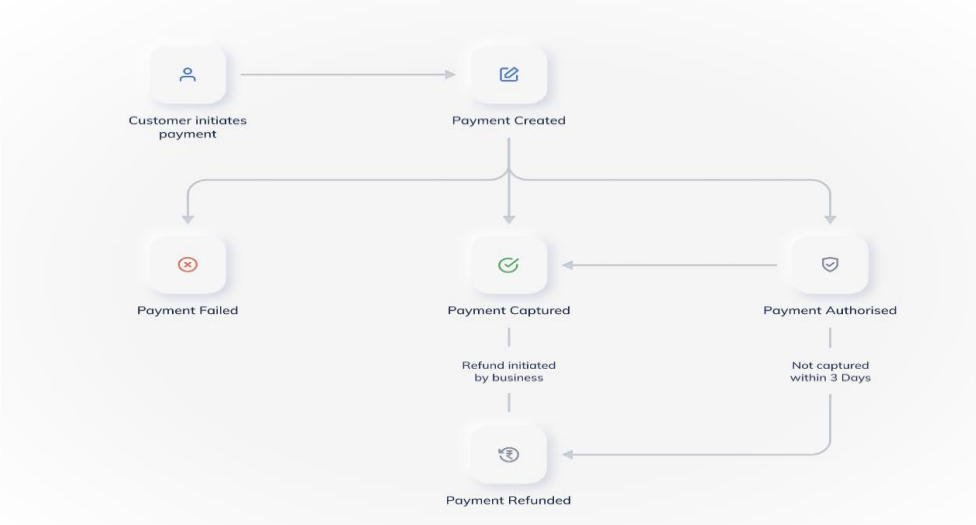

- The TLS protocol is used to encrypt your servers' communications with Razorpay, so it's important that your integration uses the latest version (TLS 1.2 is much more secure than its predecessors.).
- As an integration checklist, please whitelist all the Webhook IP's.

9. What prerequisites need to be maintained when using .NET as the backend language ?

You must use .NET 4.5 or above, with TLS version 1.2. Using it with a lower .NET version will lead to errors. Check the FAQs & Troubleshooting steps.

10. What are the different cycles that payments go through ?

To know about the payment states, please refer:
https://razorpay.com/docs/payments/payments/#payment-life-cycle

11. On what status should the payment be considered as successful ?

Consider only the "captured" state to mark the payment successful.

Process FAQs

1. What are the details to be submitted once the integration is completed ?

The two documents to be submitted once integration completed are:

- Integration checklist
- A PDF with payment flow screenshots.

Sample of above required documents is provided during onboarding / in onboarding KIT.

Standard vs Custom checkout

Aspect	Standard Checkout	Hosted Checkout
Usability		
Integration	Integrated directly into your website or application	Standard redirection-based integration where the complete checkout is developed and managed by Razorpay
Customization on UI	Highly customizable	Limited customization options
Control	More control over the checkout experience	Lets you hand over control of the entire checkout process to Razorpay
User Experience	Pop-up view where customers enter payment details	Full-page view with secure redirection to a separate page hosted by Razorpay
Use Case	Suitable for full integration and customization	Ideal for quick setup with minimal effort
Product Features		
EMI, Offers, and UPI Intent	Supported	Not supported
Payment Methods	Customizable payment methods	Available payment methods cannot be changed
Platform	Suggested for both mobile and web.	Suggested for websites only
Payment Methods	All payments methods available	QR code not available
Tokenization	Supported	Not Supported
Bank Transfer methods	Supported	NEFT/IMPS/RTGS not supported
